

Spanish Navy collaboration with the NATO MGEOMETOC COE during the REPMUS21 Exercise

Under the scope of the REPMUS21 exercise the Spanish Navy collaborated with the NATO MGEOMETOC COE in the combined hydrographic survey on a near shore area, using an unmanned surface vehicle (USV), complemented by an aerial drone (UAV) from The Netherlands Royal Navy, equipped with a multispectral camera from the Portuguese Navy. The goal of this experiment was to plan and prepare an amphibious landing operation, as part of the Rapid Environmental Assessment capability coordinated by the NATO MGEOMETOC COE.
